Row	first_order ▾	last_order ▾	
1	2016-09-04 21:15:19 UTC	2018-10-17 17:30:18 UTC	

Insights-

1. The very first\_order was done on 2016-09-04 21:15:19.
2. The last order was done on 2018-10-17 17:30:18.

### 1.3. Count the Cities & States of customers who ordered during the given period.

```
SELECT COUNT(DISTINCT customer_city)CITY_COUNT,COUNT(DISTINCT customer_state)
)STATE_COUNT
FROM `target.customers`
```

```
INNER JOIN `target.orders`
USING(CUSTOMER_ID);
```

## Output

The screenshot shows a data interface with a sidebar on the left containing a tree view of tables: target, customers, geolocation, order\_items, order\_reviews, orders, and payments. The main area displays 'Query results' for the 'target.orders' table. The results are shown in a table with columns: Row, CITY\_COUNT, and STATE\_COUNT. The first row shows 4119 for CITY\_COUNT and 27 for STATE\_COUNT.

Row	CITY_COUNT	STATE_COUNT
1	4119	27

## Insights-

1.No repetitive cities and states are included.

## 2.1 Is there a growing trend in the no. of orders placed over the past years?

```
select extract(year from order_purchase_timestamp)year,
extract(month from order_purchase_timestamp)month,
count(order_id)Total
from `target.orders`
group by year,month
order by year,month;
```

## Output-

The screenshot shows a data interface with a sidebar on the left containing a tree view of tables: farmers\_market, imdb, target, customers, geolocation, order\_items, order\_reviews, orders, and payments. The main area displays 'Query results' for the 'target.orders' table. The results are shown in a table with columns: Row, year, month, and Total. The first 10 rows show data for 2016 and 2017.

Row	year	month	Total
1	2016	9	4
2	2016	10	324
3	2016	12	1
4	2017	1	800
5	2017	2	1780
6	2017	3	2682
7	2017	4	2404
8	2017	5	3700
9	2017	6	3245
10	2017	7	4026

## Insights-

- From the given date we have only 3 months of data in the year 2016. In the next year We have all months data that makes it to total of 45101 orders and in the next year the orders are increased to 54011. So from the past 3 years the orders are increasing.

## 2.2. Can we see some kind of monthly seasonality in terms of the no. of orders being placed?

```
SELECT EXTRACT(MONTH FROM
order_purchase_timestamp)MONTH_WISE_SALES,COUNT(ORDER_ID)Total
FROM `target.orders`
GROUP BY MONTH_WISE_SALES
ORDER BY MONTH_WISE_SALES;
```

Output-

Query results	
JOB INFORMATION	RESULTS
Row	MONTH_WISE_SALE Total
1	8069
2	8508
3	9893
4	9343
5	10573
6	9412
7	10318
8	10843
9	4305
10	4959
11	7544
12	5674

Insights-

1. In January and February we have decent number of orders . But in the next 6 months that is from march to august the orders are gone up. Similarly the orders are reduced from sept to dec.
2. So it is advisable to have good amount of storage in mar-aug season.

2.3. During what time of the day, do the Brazilian customers mostly place their orders? (Dawn, Morning, Afternoon or Night)

```
select order_time,count(order_id)Total
from
(SELECT order_id,
CASE WHEN EXTRACT(TIME FROM order_purchase_timestamp) BETWEEN '00:00:00' and
'05:59:59' THEN 'Dawn'
WHEN EXTRACT(TIME FROM order_purchase_timestamp) BETWEEN '06:00:00' and
'11:59:59' THEN 'Mornings'
WHEN EXTRACT(TIME FROM order_purchase_timestamp) BETWEEN '12:00:00' and
'17:59:59' THEN 'Afternoon'
else 'Night'end order_time
FROM `target.orders`)tbl
group by order_time;

6	RJ	2016	10	56
7	MT	2016	10	3
8	GO	2016	10	9
9	MG	2016	10	40
10	CE	2016	10	8

Insights-

1. A total of 654 orders have been received from the state SP alone in February 2017 which is the highest among all the states in a single month.
2. Increase the orders in the other state as well by giving discount, buy one get one free, combo Offers.

### 3.2. How are the customers distributed across all the states?

```
select customer_state, count(customer_id) Total_customers
from `target.customers`
group by customer_state
order by Total_customers desc;
```

Output-

Row	customer_state	Total_customers
1	SP	41746
2	RJ	12852
3	MG	11635
4	RS	5466
5	PR	5045
6	SC	3637
7	BA	3380
8	DF	2140
9	ES	2033
10	GO	2020

Insights-

- 1.SP RJ and MG are the top three states in terms of number of orders.

4.1. Get the % increase in the cost of orders from year 2017 to 2018 (include months between Jan to Aug only).

```
with cte as
  (select extract(year from order_purchase_timestamp)year,sum(payment_value)cost
   from `target.payments`
   inner join `target.orders`
   using (order_id)
   where extract(month from order_purchase_timestamp) between 01 and 08
   group by year
   order by year),

  cte1 as
  (select year,cost,lead(cost) over(order by year)next_cost,(((lead(cost) over(order
by year)-cost)/cost)*100)change_in_percentage
   from cte)

select round(change_in_percentage)
from cte1
limit 1;
```

Output-

Query results			
JOB INFORMATION		RESULTS	CHART
Row	f0_		
1		137.0	

Insights-

1. There has been approximately 137% change in cost of orders in the year 2018 compared to 2017.  
For comparison only jan-aug months have been included from both the years.

4.2. Calculate the Total & Average value of order price for each state

```
select customer_state,round(sum(price),2)total_value,round(avg(price),2)avg_value
from `target.customers`
inner join `target.orders` o
using(customer_id)
inner join `target.order_items` oi
on o.order_id=oi.order_id
group by customer_state
order by total_value desc,avg_value desc;
```

Output-

JOB INFORMATION		RESULTS	CHART	JSON	EXECUTION DETAILS	EXECUTION GRAPH
Row	customer_state	total_value	avg_value

8	DF	302603.94	125.77			
9	GO	294591.95	126.27			
10	ES	275037.31	121.91			

Insights-

1. SP, RJ and MG are top three states in terms of total value.
2. PB, AL and AC are top three states in terms of average value of an order.

4.3. Calculate the Total & Average value of order freight for each state.

```
select
customer_state,round(sum(freight_value),2)total_freight_value,round(avg(freight_value
),2)avg_value
from `target.customers`
inner join `target.orders` o
using (customer_id)
inner join `target.order_items` oi
on o.order_id=oi.order_id
group by customer_state
order by total_freight_value desc,avg_value;
```

Output-

JOB INFORMATION		RESULTS	CHART	JSON	EXECUTION DETAILS	EXECUTION GRAPH
Row	customer_state	total_freight_value	avg_value			
1	SP	718723.07	15.15			
2	RJ	305589.31	20.96			
3	MG	270853.46	20.63			
4	RS	135522.74	21.74			
5	PR	117851.68	20.53

7	SC	89660.26	21.47			
8	PE	59449.66	32.92			

Insights-

1. SP, RJ, MG are having more freight value because the orders from these states are also more.
2. RR, PB, RO are having more average freight value than all other states.

- Prefer road and rail transport options which are cheaper than air transport to Reduce the freight charges.

### 5.1. Find the no. of days taken to deliver each order from the order's purchase date as delivery time.

```
select order_id,date_diff(order_delivered_customer_date,
order_purchase_timestamp,day)time_to_deliver,
date_diff(order_delivered_customer_date,
order_estimated_delivery_date,day)diff_estimated_delivery
from `target.orders`;

group by customer_state

```

```
order by difference desc) tbl
where rnk<=5;
```

Output-

The screenshot shows a database interface with a sidebar on the left containing a tree view of databases (imdb, target) and tables (customers, geolocation, order\_items, order\_reviews, orders, payments, products, sellers). The main area displays 'Query results' for a query. The results are shown in a table with columns: Row, customer\_state, and difference. The data is as follows:

Row	customer_state	difference
1	AL	-7.98
2	MA	-9.11
3	SE	-9.17
4	ES	-9.77
5	BA	-10.12

Below the results table, there is a 'Job history' section. At the bottom of the interface, there is a search bar and a taskbar with various application icons.

Insights-

1. AL, MA, SE, ES, BA are the states where the order delivery is slow among all the states as compared to the estimated date of delivery.

### 6.1 Find the month on month no. of orders placed using different payment types.

```
select extract(year from order_purchase_timestamp)year,extract(month from
order_purchase_timestamp)month,
payment_type,count(order_id)Total
from `target.orders`
inner join `target.payments`
using(order_id)
group by year,month,payment_type
order by year,month;
```

Output-

The screenshot shows a database interface with a sidebar on the left containing a tree view of databases (farmers\_market, imdb, target) and tables (customers, geolocation, order\_items, order\_reviews, orders, payments, products, sellers). The main area displays 'Query results' for a query. The results are shown in a table with columns: Row, year, month, payment\_type, and Total. The data is as follows:

Row	year	month	payment_type	Total
1	2016	9	credit_card	3
2	2016	10	credit_card	254
3	2016	10	UPI	63
4	2016	10	voucher	23
5	2016	10	debit_card	2
6	2016	12	credit_card	1
7	2017	1	credit_card	583
8	2017	1	UPI	197
9	2017	1	voucher	61
10	2017	1	debit_card	9

## Insights-

1. From the data provided we can see that we have only 3 months(9,10,12) data in the year 2016.
2. Multiple payment options voucher, credit card, UPI, Debit card were used for making the payments.

## 6.2 Find the no. of orders placed on the basis of the payment installments that have been paid.

```
select payment_installments,count( order_id)total
from `target.payments`
where payment_installments >0 and payment_value>0
group by payment_installments;
```

## Output-

Search to search ?		Query results			
resources.		JOB INFORMATION		RESULTS	CHART JSON
